Work Experience

FULL STACK DEVELOPER, SECURED FORTUNE TECHNOLOGIES Link — Sep 2025 - Mar 2026

- **Architected and built the entire marketplace backend from scratch** — database schema, API structure, auth system, and deployment pipeline, independently with no existing codebase to reference.
- Built **geo-aware listing search using PostGIS in PostgreSQL** — integrated **Ola Geocoding API** to store coordinates and enabled radius-based queries that SQL ILIKE could not support.
- **Implemented JWT-based RBAC** with many roles (super admin, admin, content moderator) — embedded permissions directly into access tokens, eliminating repeated DB authorization queries across 33+ backend modules.
- Built a **dual-channel OTP auth system using Redis TTL for automatic token expiry** — eliminated cron job dependency and reduced DB write load on high-volume auth routes.
- **Designed a content moderation pipeline** with a multi-level self-referential category system — listings enter pending state, moderators approve or reject with comments, and listings are discoverable through all parent categories automatically.
- Implemented **Redis + BullMQ async job** queues for OTP emails, SMS. — decoupled third-party service delays from the request lifecycle and improved API response latency.
- **Built Elasticsearch-powered** search with real-time PostgreSQL sync and a Socket.io WebSocket server with JWT-based authentication — enabled fuzzy search, geo-radius filtering, and real-time direct messaging with role and organization based rooms.
- **Migrated full production deployment from AWS to Contabo VPS** — configured multi-container **Docker Compose** for dev and prod environments, **Nginx reverse proxy**, **SSL certificates**, and domain routing with zero downtime.
- Implemented a **database-driven notification system using PostgreSQL** — stored notifications as structured records with read/unread status, enabling users to query, paginate, and manage notifications without dependency on third-party push services.

Technical Skills

Core Concepts : MicroServices, Data Structures & Algorithms, API Design, OOPs, Caching, System Design, DBMS, OS.

Programming Languages : JavaScript (ES6+), Java, HTML, CSS, TypeScript.

Frontend Technologies : React.js, Next.js, Redux-Toolkit, Tailwind CSS, Bootstrap, Responsive Design.

Backend Technologies : Node.js, Express.js, SpringBoot, RESTful APIs, JWT Authentication, Bcrypt, .

Databases : MongoDB, PostgreSQL, MySQL

DevOps & Tools : AWS (EC2, S3, RDS), Docker, Redis, Git GitHub.

Education

R.D Engineering College Ghaziabad, India — 2021-2025
Computer Science and Engineering | CGPA: 7

Projects

MATCH-VERSE (DATING APPLICATION) Link

- Developed a full-stack dating platform using the MERN stack with JWT authentication, swipe/feed-based matching system, real-time messaging, and Razorpay subscription integration, building 13+ secure REST APIs to support scalable user interactions and premium feature purchases for 1000+ users.

MOVIE-GPT - AI-POWERED STREAMING PLATFORM Link

- Developed a Netflix-inspired streaming platform using React.js, Redux, and Tailwind CSS with Firebase authentication, TMDB API integration for dynamic movie data and trailer streaming, and OpenAI-powered movie search that generates personalized movie recommendations from natural language prompts .
